

Scaling a Dutch Magnet Fishing Brand to 336 Purchases at 5.34× ROAS

Meta Ads | E-commerce | Netherlands | 5.6 Months

Business Overview

A Netherlands-based **e-commerce brand in the magnet fishing niche**, selling fishing magnets and related accessories designed for recreational magnet fishing.

Business Snapshot

- **Niche:** Magnet Fishing / Outdoor Recreation
- **Target Market:** Netherlands
- **Primary Audience:** Magnet fishing enthusiasts, outdoor hobbyists, and people interested in recreational exploration

Business Goal

The primary objective was to build a **profitable customer acquisition system through Meta Ads**, using reliable tracking, audience testing, creative experimentation, and continuous optimization to increase online purchases.

The Challenge

When I started the project, the account had limited usable campaign data and no clear creative direction for paid social.

The key challenges were:

- Establishing reliable purchase tracking
- Understanding the most relevant audience segments
- Identifying effective creative angles for the product

- Determining whether broad or manually defined targeting would perform better
- Maintaining performance as creatives fatigued
- Managing performance changes after an inventory-related campaign pause

The first priority was therefore to **build a reliable measurement and testing foundation before scaling spend**.

My Approach

I structured the campaign around five core areas:

Tracking → Research → Creative Strategy → Audience Testing → Continuous Optimization

01. Business Discovery & Tracking Foundation

I started with a strategy meeting with the client to understand the business, products, target market, customer profile, and campaign objectives.

After gaining the required account and website access, I set up and verified the purchase conversion tracking before launching the main sales campaign.

This created the foundation for making optimization decisions based on reliable purchase data rather than assumptions.

My principle:

If the data is unreliable, the optimization process is unreliable.

02. Initial Data Collection

Rather than immediately relying only on purchase optimization, I first used an awareness-focused campaign to generate initial audience and engagement signals.

This provided early insights into:

- Audience response
- Content engagement
- Video consumption
- Click behavior
- Creative performance

The purpose was to establish initial data that could inform the next stage of the campaign.

03. Audience & Market Research → Creative Strategy

The client did not have a clear direction for the type of video content needed for paid advertising.

I researched the target market, audience characteristics, product use cases, and customer motivations to develop a practical creative strategy.

I recommended content focused on:

- Showing the fishing magnet in real-world use
- Demonstrating ease of use
- Communicating practical product benefits
- Showing the complete product bundle
- Creating curiosity around magnet fishing

The client then produced video creatives based on these recommendations.

This made creative development part of the **performance strategy**, rather than treating creative as a separate production task.

04. Purchase Campaign & Early Validation

Once tracking and creative assets were ready, I launched the purchase-focused campaign.

The campaign generated its **first purchase within three days**.

From there, I monitored purchase volume, cost per purchase, ROAS, CTR, CPC, audience behavior, and creative performance to identify what was working and where further testing was needed.

05. Advantage+ vs. Manual Audience Testing

One of the key strategic tests was comparing broad targeting with manually defined targeting.

Advantage+ / Broad Audience

- Broad audience approach
- No unnecessary interest restrictions
- No strict age restrictions
- Allowed Meta to identify potential buyers based on its optimization signals

Manual Audience

- Selected interests
- Demographic considerations
- More controlled audience parameters

Initially, the broad Advantage+ approach generated stronger purchase volume.

However, I did not immediately shut down the manual audience. I allowed it to continue gathering data and monitored whether performance improved with additional learning.

Over time, the manual audience also began generating purchases.

This helped determine how much control should be given to Meta's automated audience system versus manually defined targeting.

Creative Optimization Became the Next Growth Lever

The campaign later faced an external constraint: the client temporarily paused advertising because the product went out of stock.

After the product was restocked and campaigns resumed, performance declined.

Creative-level performance showed that **one creative continued generating results while several others were no longer performing efficiently**.

Rather than immediately rebuilding the entire targeting strategy, I focused on the more immediate issue: **creative fatigue and message effectiveness**.

I developed new creative directions around:

- Product demonstrations
- Ease of use
- Real-world applications
- Clearer product communication
- The experience of magnet fishing

The refreshed creatives helped restore purchase activity and gave the campaign new messaging to work with.

5.6-MONTH CAMPAIGN PERFORMANCE		
METRIC		PERFORMANCE
	Purchases	336
	ROAS	5.34×
	Meta-attributed Revenue	€16,044.30
	Ad Spend	€3,006.51
	Cost per Purchase	€8.95
	CTR	3.96%
	CPC	€0.14
	Clicks	21,571
	Impressions	545,234
	Reach	224,043
	25% Video Plays	123,345

What Made the Campaign Work

Measurement Before Optimization

Purchase tracking was established and verified before major campaign decisions were made.

Strategy Before Creative Production

Creative concepts were developed from audience, product, and market research rather than asking the client to produce generic product videos.

Testing Instead of Assumptions

Broad Advantage+ targeting was tested against manually defined audiences to determine which approach could generate

purchases.

Data Before Decisions

The manual audience was not shut down prematurely. Additional data was allowed to determine whether its performance could improve.

Creative-Led Optimization

When performance declined after the inventory interruption, creative-level performance was analyzed before making major structural changes.

Continuous Optimization

The campaign was continuously monitored and refined based on purchase efficiency, creative performance, audience behavior, and campaign conditions.

Final Outcome

Over **5.6 months**, the campaign generated **336 purchases** and **€16,044.30 in Meta-attributed revenue** from **€3,006.51 in ad spend**, achieving a **5.34× ROAS**.

The project demonstrated a structured performance marketing process:

Understand the business → establish reliable tracking → research the audience → develop creative strategy → test targeting → analyze performance → refresh creative → optimize continuously.

The result was not dependent on one targeting trick or one winning ad.

It came from **structured experimentation, reliable measurement, and disciplined optimization.**
